Office Action Summary

Application No.

10/601,037

Applicant(s)

HUOTARI, HANNU

Examiner

Christy L. Novacek

Art Unit

2822

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 28 January 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 15-24 and 27-42 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 15-24 and 27-42 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 20 May 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

This office action is in response to the amendment filed January 28, 2005.

Claim Rejections - 35 USC § 103

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 15-24, 27-38 and 40-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bai et al. (US 6,166,417, previously cited) in view of Elers et al. (WO 01/29893 A1, previously cited) and Pomarede et al. (US 20020098627).

Regarding claim 1, Bai discloses depositing a gate dielectric layer (120) over first and second regions (105/115) of a substrate, depositing a barrier layer (125) directly over the gate dielectric layer such that it overlies both the first and second regions, and forming first and second gate electrode layers (130/135) over the first and second regions, respectively (col. 3, ln. 17 - col. 4, ln. 64). Bai states that the function of the barrier layer is to “inhibit interaction between the gate dielectric and the gate electrode.” Thus, the barrier layer must be able to keep metal atoms in the gate electrode from diffusing into the underlying gate dielectric.

Bai does not disclose by what method the barrier layer may be deposited. Like Bai, Elers discloses depositing a barrier layer onto a layer of SiO₂ dielectric. Elers states that it is advantageous to form barrier layers such that they are nanolaminates because nanolaminates “have enhanced diffusion barrier properties” by virtue of their structure having “very complicated diffusion paths for impurities through disruption of normal crystal growth during deposition” (pg. 8, ln. 20-25). The nanolaminate barrier layer is formed by an ALD (atomic layer deposition process) (pg. 1, ln. 28-32). At the time of the invention, it would have been

Art Unit: 2822

obvious to one of ordinary skill in the art to form the barrier layer of Bai such that it is a nanolaminate deposited by ALD because Elers teaches that a nanolaminate structure provides enhanced diffusion barrier properties and Elers teaches that ALD is the way in which such a structure is created.

Bai discloses that the gate dielectric layer may be grown or deposited. Bai also states that the gate dielectric may be a high dielectric constant (high-k) layer (col. 3, ln. 17-26). However, Bai does not disclose that the gate dielectric layer is deposited by an ALD process. Like Bai, Pomarede discloses depositing a high-k gate dielectric layer on a semiconductor substrate. Pomarede teaches that the high-k gate dielectric layer can be advantageously deposited by using an ALD process. Pomarede teaches that the ALD process is self-limiting and can be used to precisely control the thickness of the gate dielectric layer since the process deposits only one monolayer of atoms at a time (para. 68-83). At the time of the invention, it would have been obvious to one of ordinary skill in the art to deposit the high-k gate dielectric layer of Bai by using the ALD process because Pomarede teaches that it is advantageous to deposit a high-k gate dielectric layer using ALD in order that the thickness of the gate dielectric layer may be controlled precisely.

Regarding claim 16, Bai discloses that one of the regions is a PMOS region and the other region is an NMOS region (col. 3, ln. 8-16).

Regarding claim 17, Bai discloses the first and second gate electrode layers are adjacent (Fig. 7).

Regarding claim 18, Bai discloses that the first gate electrode layer includes a first gate electrode material and the second gate electrode includes a second gate electrode material (col. 3, ln. 55-65; col. 4, ln. 41-53).

Regarding claims 19 and 20, Bai discloses that if the first gate electrode is made of N-type material, the second electrode will be made of P-type material, and vice-versa. The first gate electrode material may include nickel or ruthenium oxide if the material is to have the work function of a P-type doped semiconductor or may include ruthenium if the material is to have the work function of an N-type doped semiconductor. The same is true for the second gate electrode. Hence, the first and second gate electrodes will be made of different conductive materials. See col. 1, ln. 42-54; col. 3, ln. 55 – col. 4, ln. 9; col. 4, ln. 41-53).

Regarding claim 21, Bai discloses that the first and second gate electrode materials may be made of nickel, ruthenium oxide or ruthenium (col. 1, ln. 41-53; col. 4, ln. 3-9; col. 4, ln. 42-53).

Regarding claim 22, Bai discloses that one of the gate electrodes may be made of a metal nitride (MoN) (col. 1, ln. 41-53).

Regarding claims 23 and 24, Bai discloses that the barrier layer may be TiN or TaN, both of which are conductive material (col. 3, ln. 51-54).

Regarding claims 27 and 28, Bai discloses that the barrier layer has a thickness of 5 – 200 (col. 3, ln. 36-37).

Regarding claims 29-32, Bai discloses that the gate dielectric layer may be a high-k layer, but Bai does not disclose a method of forming the dielectric layer, nor treating the dielectric layer to remove OH groups. Pomarede teaches that it is advantageous to treat a layer such as a

Art Unit: 2822

high-k gate dielectric layer with a mixture including ammonia (nitrogen-hydrogen) plasma and nitrogen radicals upon which subsequent layers will be deposited (para. 84-90). This process inherently replaces OH groups on the surface of the high-k dielectric layer with nitrogen atoms. Pomarede states, "By changing the surface termination of the substrate [high-k dielectric] with a low temperature radical treatment, subsequent deposition is advantageously facilitated without significantly affecting the bulk properties of the underlying material." (Abstract). At the time of the invention, it would have been obvious to one of ordinary skill in the art to treat the surface of the gate dielectric film of Bai as is taught by Pomarede because Pomarede teaches that it is advantageous to change the surface termination of a high-k gate dielectric film that will have additional layers subsequently deposited thereon.

Regarding claim 33, Bai discloses depositing a layer of first gate electrode material (130 or 135 can be considered "a first gate electrode layer") over the first and second regions of the substrate (Fig. 4 and 6).

Regarding claim 34, Bai discloses removing the first gate electrode material from over the second region without removing the underlying barrier layer (Fig. 5 and 7).

Regarding claim 35, in the event that the material 135 is considered to be the first gate electrode material, Bai discloses that the first gate electrode material is removed from over the second region by chemical mechanical polishing (col. 4, ln. 55-64).

Regarding claim 36, Bai discloses depositing a layer of second gate electrode material (130 or 135 can be considered "a second gate electrode layer") over the first and second regions of the substrate (Fig. 4 and 6).

Regarding claim 37, in the even that the material 130 is considered to be the first gate electrode material, Bai discloses that the first gate electrode material is removed from over the second region by differential etching (col. 29-33).

Regarding claims 38 and 41, Bai discloses depositing a layer of second gate electrode material (130 or 135 can be considered "a second gate electrode layer") over the first and second regions of the substrate and removing the second gate electrode material from over the first region without removing the underlying barrier layer (Fig. 5, 7 and 8).

Regarding claim 40, Bai discloses etching the barrier layer over portions of the second region to a thickness of 0 Angstroms (Fig. 8).

Regarding claim 42, Bai discloses depositing a dielectric layer (120) over first and second regions (105/115) of a substrate, depositing a barrier layer (125) directly over the dielectric layer such that it overlies both the first and second regions, depositing a first gate electrode material (130 or 135) over the first and second regions, removing the first gate electrode material from over the first region without removing the barrier layer, depositing a second gate electrode material (135 or 130), and defining a first and second electrode in the first and second regions.

Claim 39 is rejected under 35 U.S.C. 103(a) as being unpatentable over Bai et al. (US 6,166,417) in view of Elers et al. (WO 01/29893 A1) and Pomarede et al. (US 20020098627), as applied to claim 15 above, and further in view of Chang et al. (US 6,660,630, previously cited).

Regarding claim 39, Bai does not disclose depositing a layer of conductive material over the first and second gate electrode layers. However, as is disclosed by Chang, it is necessary in the fabrication of semiconductor devices such as that of Bai, to deposit multi-layered conductive interconnection structures above the gates of a semiconductor device in order to provide required

Art Unit: 2822

wiring to the gates of the device (col. 1, ln. 34-65). Such structures are well-known in the art. At the time of the invention, it would have been obvious to one of ordinary skill in the art to deposit conductive material over the first and second gate electrode layers of Bai for the purpose of forming a multi-layered interconnection structure that connects the gate with upper-level wiring because such structures are necessary to the function of the gate and are well-known in the art.

Response to Arguments

Applicant's arguments filed January 28, 2005 have been fully considered but they are not persuasive.

Applicant has provided evidence in this file showing that the invention was owned by, or subject to an obligation of assignment to, the same entity as Pomarede (US 6,613,695) at the time this invention was made. Accordingly, Pomarede (US 6,613,695) is disqualified as prior art through 35 U.S.C. 102(e), (f) or (g) in any rejection under 35 U.S.C. 103(a) in this application. However, US Application No. 09/944734, which eventually matured into the Pomarede US 6,613,695 patent, was published as US 20020098627 on July 25, 2002. This publication predates the filing of Applicant's application. Therefore, US 20020098627 additionally qualifies as prior art under subsection of 35 U.S.C. 102 (a) and, accordingly, is not disqualified as prior art under 35 U.S.C. 103(a).

Regarding claims 15 and 42, Applicant argues that Elers allegedly fails to provide motivation for forming the barrier layer of Bai such that it is an ALD nanolaminate because Elers' barrier layer is used in a damascene structure, whereas Bai's barrier layer is used in a gate electrode. The motivation for combining the teachings of Elers with the invention of Bai is that

Art Unit: 2822

Bai teaches no method of forming the barrier layer, while Elers teaches that the specific method of forming a barrier layer such that it is a nanolaminate deposited by ALD serves to form an unusually successful barrier layer because such a layer has “very complicated diffusion paths for impurities through disruption of normal crystal growth during deposition”. Elers teaches that, in particular, this barrier layer can be used to prevent diffusion between an overlying metal layer and an underlying dielectric layer. Bai’s invention includes a barrier layer designed to “prevent physical interaction” (diffusion) of an overlying metal layer and an underlying dielectric layer. Therefore, it would have been obvious to one of ordinary skill in the art to use the diffusion barrier formation method of Elers to form the diffusion barrier of Bai.

Regarding Applicant’s argument that one of ordinary skill in the art would not be motivated to use ALD to form the barrier layer of Bai, Applicant states, “The skilled artisan would not be motivated to use the ALD process disclosed by Elers because of the high cost associated with the monolayer by monolayer deposition of the barrier layer by the process disclosed in Elers.” Even if these statements regarding the disadvantages of the ALD process were true, it is obviously not enough of a disadvantage to persuade one of ordinary skill in the art against using ALD to deposit gate barrier layers because that is exactly what the Applicant has done in his invention. Applicant’s argument that one of ordinary skill in the art would not use ALD to deposit layers in a situation in which high conformality is not required is belied by their own use of ALD to deposit a layer in the same situation and also by the Pomarede patent which discloses using ALD to deposit a gate dielectric layer onto a flat substrate. Here, the Examiner points to Applicant’s own specification not as a source of motivation for using ALD, but merely

Art Unit: 2822

as evidence to refute Applicant's position that in light of all knowledge, one of ordinary skill in the art would not use ALD to deposit a gate barrier layer.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christy L. Novacek whose telephone number is (571) 272-1839. The examiner can normally be reached on Monday-Thursday and alternate Fridays 7:30 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amir Zarabian can be reached on (571) 272-1852. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
